System Vision Document
Code Clinic Booking System

This document outlines the overall goals, requirements, and capabilities of the Booking System, guiding its overall design, development, and implementation.

Problem Statement

Students from diverse backgrounds and varying programming experience levels study together at WeThinkCode, within a collaborative environment. However less experienced students often struggle and may require guidance from their (more experienced) peers.

The uncertainty of whether more experienced students are available to help can create a barrier, leaving struggling students hesitant to seek support. A system that enables experienced students to share their availability and allows students in need to easily book help sessions, would bridge this gap.

Vision Statement

Creating a vibrant community where students can share knowledge, grow together, and thrive. Having a platform that connects those who need help with those who can offer it, fostering a spirit of collaboration and mutual support that drives collective success.

System Capabilities

Configuration

- Connect to Google Calendars (Clinics & WTC_)
- Store configuration data securely

Calendar Management

- Download and store (weekly) calendar data
- View upcoming bookings and availability

Volunteer Management

- Volunteer for available slots w/ description
- Cancel user-created volunteering

Booking Management

- Make bookings for available slots
- Cancel existing user-created bookings

User Interface

- Provide helpful command-line interface
- Display output in a convenient format

Assumptions & Constraints

Assumptions

- Students have Google Calendar accounts and are familiar with their usage.
- Students have access to Linux workstations or laptops on campus.
- Command-line interface is suitable for the target user group.
- Google Calendar API will be available and functional throughout the system's operation.

Constraints

- All data must be stored client-side, with no server-side storage.
- The user interface must be command-line based (no graphical interface).
- The system requires an internet connection to interact with Google Calendar API.
- The system must run on the Linux version used on campus.
